

8. REGULATIONS AND ADVISORIES

International, national, and state regulations and advisories regarding atrazine in air, water, and other media are summarized in Table 8-1. These values have been established because of the potential for atrazine to cause adverse health effects in exposed people.

The EPA (IRIS 2001) has calculated a chronic oral Reference Dose (RfD) for atrazine of 3.5×10^{-2} mg/kg/day based on a NOAEL of 3.5 mg/kg/day for decreased body weight gain in rats exposed for their lifetimes to 70 ppm atrazine in the diet (Ciba-Geigy Corp. 1986). The NOAEL of 3.5 mg/kg/day atrazine was divided by uncertainty factors of 10 for extrapolation from animals to humans and 10 for human variability in sensitivity. EPA has not derived a Reference Concentration (RfC) for chronic inhalation or done a carcinogenicity assessment for lifetime exposure.

No inhalation MRLs have been derived for atrazine due to lack of data. An MRL of 0.01 mg/kg/day has been derived for acute-duration oral exposure (14 days or less) to atrazine based on a NOAEL of 1 mg/kg/day for decreased body weight gain in pregnant rabbits exposed to atrazine on gestational days 7–19 (Infurna et al. 1988) and an uncertainty factor of 100 (10 for extrapolation from animals to humans and 10 for human variability). No MRL has been derived for intermediate-duration oral exposure because the lowest LOAEL resulted in serious reproductive effects. Pigs exposed to 1 mg/kg/day atrazine for 19 days had altered serum estradiol concentrations and anestrus (Gojmerac et al. 1999); a NOAEL was not established. No chronic-duration oral MRL was derived because the lowest NOAEL (2.4 mg/kg/day; EPA 1987b) was higher than the lowest intermediate-duration LOAEL (1 mg/kg/day; Infurna et al. 1988), which resulted in serious effects (anestrus).
